Ear patch · لزقة الأذن

New product concept — adhesive noise-reducing patch, nothing goes inside the ear. For factory prototyping.

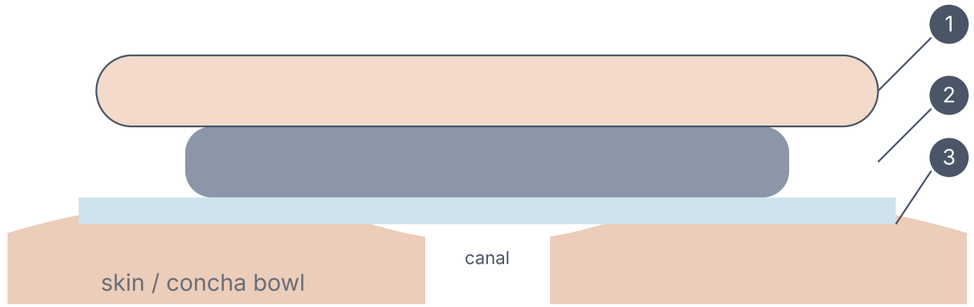

relieve.

TOP VIEW · SHAPE

- Teardrop shaped to sit in the concha bowl around the canal opening.
- Sizes: S 30×36 · M 34×40 · L 38×44 mm (to be refined on samples).
- Pull tab for painless removal; pebble mark embossed on the tab side.

CROSS-SECTION · 3 LAYERS

1. **Soft outer foam** (1–1.5 mm): comfortable when sleeping on the side, quiet against the pillow.
2. **Dense, flexible mass layer** (1.5–2 mm, e.g. high-density silicone / TPE): the part that actually blocks sound. Mass, not foam, stops noise.
3. **Medical silicone-gel adhesive ring** (skin-safe, latex-free): seals airtight around the opening, removes without pain, can be re-applied for several nights.

ASK THE FACTORY TO SAMPLE 3 VERSIONS

- **A** — thin (total ≈2.5 mm): most comfortable.
- **B** — standard (≈3.5 mm): balance.
- **C** — max block (≈4.5 mm, heavier mass layer).

Target: re-usable 3–5 nights, breathable enough to avoid moisture build-up, no residue, hypoallergenic. Please provide a lab attenuation test (SNR/NRR) on the chosen version before we print any number on packaging.

COLOURS

- Skin light
- Skin tan
- Mist (brand)
- Night (brand)

RISKS TO CHECK ON SAMPLES

- Seal breaks when sleeping on the side → noise leaks in. Test on real users, both sides.
- Moisture / ear-wax under the patch overnight → check skin after 8 h.
- Must not be used by young children (choking / removal) — label accordingly.
- Will reduce noise less than deep-fitting foam plugs; the promise is **comfort + less noise**, not silence.
